Clock Lab

Synthetic requirements - revision 1

Memory inputs

Limit: 16 MiB. Buffer A: 6 MiB. Buffer B: 6 MiB. Workspace: 5 MiB.

MiB is binary: 1,048,576 bytes.

Allocation lifetimes are unknown. Do not assume overlap or reuse.

Power assumptions

Supply: 5 V. Declared current limit: 300 mA.

Typical assumed currents: controller 120 mA; display 100 mA; sensor 30 mA.

Typical values do not establish worst-case behavior. No measurement is supplied.

Investigation

Read the source files and identify the information still needed.

Keep assumptions, source revisions and actual tool results with the question.

Workbook: input data. Board: later geometry checks. Python: unexecuted stub.

Invented exercise. These are not specifications for real ARC hardware.
